Systematic Analysis of a Phenol

Experiment 6 - Practical Notes

Name: _____ Roll no.: _____ Date: _____

Aim

To organise an illustrative unknown-identification record and show how the assigned candidate is supported.

Principle

This is a worked teaching case, not an observation to copy into a laboratory record. An actual unknown is assigned by the instructor and may give different findings. A candidate is supported by consistent preliminary, elemental, functional and physical evidence.

Requirements

- Instructor-assigned unknown and the corresponding known control; the method notes in this subject.
- Prepared test reagents, separate test portions and calibrated physical-constant apparatus.

Procedure

1. Preliminary examination

Record the actual state and water behaviour at the prescribed quantity and temperature. Compare with the illustrative pattern below.

2. Solubility classification

Test fresh portions in the assigned acid/base reagents. Describe dissolution or effervescence before inferring a class.

3. Elements

Use the instructor-prepared extract or provided elemental report. Distinguish an element finding from a functional-group conclusion.

4. Functional confirmation

Run the assigned ferric-complex and phenol confirmation with a known control; interpret colour under that method

5. Physical confirmation

Measure the dry parent solid and the assigned purified phenol derivative, using verified comparison values.

6. Conclude

Write the candidate only after reviewing all evidence; list a plausible alternative and the test that distinguishes it.

Pharmaceutical Organic Chemistry

Observations and Record

Evidence	Illustrative finding
State / water behaviour	White to pale solid; Poor water solubility
Acid-base pattern	Dissolves in hydroxide; ordinary bicarbonate response is negative
Elements	Nitrogen, sulphur and halogens negative in the teaching pattern
Functional pattern	Run the assigned ferric-complex and phenol confirmation with a known control; interpret colour under that method
Physical constant	Typical melting region near 121°C
Supported candidate	2-Naphthol

Worked Example

The numbers below are illustrative; enter your own observations in the record.

- Record the candidate as 2-Naphthol only if your own results support the pattern. An anomalous physical constant should be investigated before final assignment.

Result

Complete the actual unknown record with its identification evidence and justified candidate.

Precautions

- Use instructor-assigned quantities and prepared test reagents in the designated laboratory; wear eye protection and use the required fume hood.
- Do not taste unknowns, smell containers directly, burn unknown halogenated material or heat sealed vessels.
- Use fresh separate portions for independent tests. A single colour reaction does not establish molecular identity.
- Its melting region overlaps benzoic acid; melting point alone cannot distinguish them.

Viva Questions and Answers**1. Can the title identify an actual unknown?**

No. The title describes this worked case; the actual material must be analysed.

2. Why perform a confirmatory measurement?

Different molecules can share solubility and functional-group reactions.

3. What belongs in the result?

The observed evidence, proposed identity and any unresolved limitation.
