

Study of Subculture, Stabs and Slants - Demonstration Study

Practical 03 | Pharmaceutical Microbiology

Aim

To study Subculture, Stabs and Slants - Demonstration Study, and interpret the recorded observations.

Principle

- Subculture transfers an established culture to another medium. Stab and slant formats differ in surface area, geometry and observation purpose.
- Interpret the prepared teaching material using the biological or quality-control principle assigned to the exercise.
- Positive, negative and procedural controls determine whether an observation can be interpreted.

Materials and Apparatus

- Completed demonstration images of labelled teaching cultures, stabs and slants.
- Instructor-supplied fixed slides, prepared demonstration images or completed teaching datasets.
- Appropriate viewing equipment, the assigned comparison/control records and an observation sheet.

Method

1. Identify the question being tested and the teaching material supplied.
2. Review the labelled demonstration sequence and identify what each stage is intended to show.
3. Compare the supplied test observations with the relevant control observations.
4. Record the morphology, pattern or numerical endpoint specified for this exercise.
5. Explain the biological meaning of the observation and identify a control failure where present.
6. Write the conclusion only to the extent supported by the completed teaching observations.

Observation Record

Complete this record using actual laboratory findings or the provided teaching data.

Observation / parameter	Record / finding
Parent identity	_____
Medium format	_____
Demonstration stage	_____
Appearance	_____
Control interpretation	_____

Calculations and Interpretation

- Describe the purpose and appearance of each prepared format; no growth-rate calculation is required.

Result

Record the actual finding, calculated value with units where relevant, and a conclusion supported by the observations.

Finding: _____

Conclusion: _____

Precautions

- Use fixed, prepared or completed teaching material specified by the instructor.
- Preserve specimen labels and avoid interpreting an uncontrolled or mixed result as a verified identity.
- Handle biological material and contaminated waste only through the laboratory arrangements provided.

Viva Questions

1. Why include a negative control?

It reveals an observation caused by background or contamination rather than the intended test.

2. What happens if a required control fails?

The affected test result cannot be accepted as a valid interpretation.
