

Study of Antibiotic Assay by Cup-Plate and Related Methods

Practical 06 | Pharmaceutical Microbiology

Aim

To study Antibiotic Assay by Cup-Plate and Related Methods, and interpret the recorded observations.

Principle

- The supplied inhibition-zone data reflect antimicrobial activity under a defined test system. Potency estimation needs a suitable reference preparation and valid controls.
- Interpret the prepared teaching material using the biological or quality-control principle assigned to the exercise.
- Positive, negative and procedural controls determine whether an observation can be interpreted.

Materials and Apparatus

- Completed teaching-zone measurements, antibiotic/reference labels and control records.
- Instructor-supplied fixed slides, prepared demonstration images or completed teaching datasets.
- Appropriate viewing equipment, the assigned comparison/control records and an observation sheet.

Method

1. Identify the question being tested and the teaching material supplied.
2. Review the labelled demonstration sequence and identify what each stage is intended to show.
3. Compare the supplied test observations with the relevant control observations.
4. Record the morphology, pattern or numerical endpoint specified for this exercise.
5. Explain the biological meaning of the observation and identify a control failure where present.
6. Write the conclusion only to the extent supported by the completed teaching observations.

Observation Record

Complete this record using actual laboratory findings or the provided teaching data.

Observation / parameter	Record / finding
Preparation label	_____
Reference level	_____
Zone diameter	_____
Replicates	_____
Control status	_____

Calculations and Interpretation

- Use the supplied validated response model to estimate potency.
- Do not assume zone diameter is proportional to concentration or compare different test systems directly.

Result

Record the actual finding, calculated value with units where relevant, and a conclusion supported by the observations.

Finding: _____

Conclusion: _____

Precautions

- Use fixed, prepared or completed teaching material specified by the instructor.
- Preserve specimen labels and avoid interpreting an uncontrolled or mixed result as a verified identity.
- Handle biological material and contaminated waste only through the laboratory arrangements provided.

Viva Questions

1. Why include a negative control?

It reveals an observation caused by background or contamination rather than the intended test.

2. What happens if a required control fails?

The affected test result cannot be accepted as a valid interpretation.
